

COLLEGE OF ENGINEERING CHERTHALA

LAB RECORD

20MCA134 – ADVANCED DBMS LAB

CERTIFICATE

*This is certified to be bonafide works of Mr./Ms.
....., In the class,
Reg. No., of College of Engineering Chertala, during
the academic year 2022-23.*

Teacher In Charge

External Examiner

Internal Examiner

Sl. No.	Name of Experiment	Page No.	Date of Experiment	Remarks
1	MySQL installation	5	21/03/2023	
2	DCL and DDL commands in SQL	7	25/03/2023	
3	DML commands in SQL	19	04/04/2023	
4	Aggregate and date functions in SQL	41	10/04/2023	
5	Types of joins in SQL	55	10/04/2023	
6	View and Indexing in SQL	71	17/04/2023	
7	PL/SQL Experiments	79	07/06/2023	
8	Stored Procedure in PL/SQL	83	07/06/2023	
9	PL/SQL block to implement cursor	89	16/06/2023	
10	PL/SQL block to implement triggers	93	27/06/2023	
11	MongoDB installation	97	04/07/2023	
12	MongoDB commands	99	11/07/2023	

MYSQL

Experiment no: 1

Install and configure client and server for MySQL (Show all commands and necessary steps for installation and configuration).

MYSQL:

MySQL is a fast, easy-to-use RDBMS being used for many small and big businesses. MySQL is developed, marketed and supported by MySQL AB, which is a Swedish company. MySQL is becoming so popular because of many good reasons –

- ☐ MySQL is released under an open-source license. So you have nothing to pay to use it.
- ☐ MySQL is a very powerful program in its own right. It handles a large subset of the functionality of the most expensive and powerful database packages.
- ☐ MySQL uses a standard form of the well-known SQL data language.
- ☐ MySQL works on many operating systems and with many languages including PHP, PERL, C, C++, JAVA, etc.
- ☐ MySQL works very quickly and works well even with large data sets.
- ☐ MySQL is very friendly to PHP, the most appreciated language for web development.
- ☐ MySQL supports large databases, up to 50 million rows or more in a table. The default file size limit for a table is 4GB, but you can increase this (if your operating system can handle it) to a theoretical limit of 8 million terabytes (TB).
- ☐ MySQL is customizable. The open-source GPL license allows programmers to modify the MySQL software to fit their own specific environments.

MySQL Features

- **Relational Database Management System (RDBMS):** MySQL is a relational database management system.
- **Easy to use:** MySQL is easy to use. You have to get only the basic knowledge of SQL. You can build and interact with MySQL with only a few simple SQL statements.
- **It is secure:** MySQL consist of a solid data security layer that protects sensitive data from intruders. Passwords are encrypted in MySQL.
- **Client/ Server Architecture:** MySQL follows a client /server architecture. There is a database server (MySQL) and arbitrarily many clients (application programs), which communicate with the server; that is, they query data, save changes, etc.
- **Free to download:** MySQL is free to use and you can download it from MySQL official website.
- **It is scalable:** MySQL can handle almost any amount of data, up to as much as 50 million rows or more. The default file size limit is about 4 GB. However, you can increase this number to a theoretical limit of 8 TB of data.
- **Compatibale on many operating systems:** MySQL is compatible to run on many operating systems, like Novell NetWare, Windows* Linux*, many varieties of UNIX*

also provides a facility that the clients can run on the same computer as the server or on another computer (communication via a local network or the Internet).

- **Allows roll-back:** MySQL allows transactions to be rolled back, commit and crash recovery.
- **High Performance:** MySQL is faster, more reliable and cheaper because of its unique storage engine architecture.
- **High Flexibility:** MySQL supports a large number of embedded applications which makes MySQL very flexible.
- **High Productivity:** MySQL uses Triggers, Stored procedures and views which allows the developer to give a higher productivity.

Installation Step of MYSQL:

Following steps are to be followed while installing MYSQL on Ubuntu operating System.

1. Connect the system with the Internet.
2. Open the terminal and Execute the command
 sudo apt-get update
 sudo apt-get install mysql-server
3. Enter the password for root as “**root**”
4. After installation enter the below command to get the MYSQL Terminal.
 | mysql -u root -p
5. Enter the earlier chosen password ie. **root**
6. Then enter the command “show database”, by this all the databases in the system will display on screen.
7. Create database.
8. Use that given database.

Result: The installation of MySQL is done successfully.

Experiment No: 2

Aim : Design any database with at least 3 entities and relationships between them. Apply DCL and DDL commands.

Objective:

- To understand the different issues involved in the design and implementation of a database system
- To understand and use Data Definition Language and Data Control Language to write query for a database

Theory:

DATA DEFINITION LANGUAGE (DDL): The Data Definition Language (DDL) is used to create and destroy databases and database objects. These commands will primarily be used by database administrators during the setup and removal phases of a database project. **Some commands of DDL are:**

- ☐ CREATE – to create table (objects) in the database
- ☐ ALTER – alters the structure of the database
- ☐ DROP – delete table from the database
- ☐ TRUNCATE – remove all records from a table, including all spaces allocated for the records are removed
- ☐ RENAME – rename a table

1. CREATE:

(a) CREATE DATABASE: You can create a MySQL database by using MySQL Command **Syntax:**

CREATE DATABASE database_name;

Example:

Let's take an example to create a database name "employees"

CREATE DATABASE employees;

We can check the created database by the following query:

SHOW DATABASES;

(b) USE DATABASE: Used to select a particular database.

Syntax:

USE database_name;

Example: Let's take an example to use a database name "customers".

USE customers;

(c) **DROP DATABASE:** You can drop/delete/remove a MySQL database easily with the MySQL command. You should be careful while deleting any database because you will lose your all the data available in your database.

Syntax:

DROP DATABASE database_name;

Example: Let's take an example to drop a database name "employees"

DROP DATABASE employees;

(d) **CREATE TABLE:** This is used to create a new relation (table)

The MySQL CREATE TABLE command is used to create a new table into the database.

Syntax:

Following is a generic syntax for creating a MySQL table in the database.

CREATE TABLE table_name (column_name column_type...);

Example:

Here, we will create a table named "student" in the database "mydatabase".

```
CREATE TABLE cus_tbl(  
  
    roll_no INT NOT NULL ,  
  
    fname VARCHAR(100) NOT NULL,  
  
    surname VARCHAR(100) NOT NULL,  
  
    PRIMARY KEY ( roll_no )
```

See the created table: Use the following command to see the table already created:

SHOW tables;

See the table structure: Use the following command to see the table already created:

```
DESCRIBE table_name;
```

2. ALTER:

MySQL ALTER statement is used when you want to change the name of your table or any table field. It is also used to add or delete an existing column in a table.

The ALTER statement is always used with "ADD", "DROP" and "MODIFY" commands according to the situation.

(a) **ALTER TABLE ...ADD...:** This is used to add some extra fields into existing relation.

Syntax: ALTER TABLE relation_name ADD (new field_1 data_type(size), new field_2 data_type(size),...);

Example: ALTER TABLE student ADD (Address CHAR(10));

(b) **ALTER TABLE...MODIFY...:** This is used to change the width as well as data type of fields of existing relations.

Syntax: ALTER TABLE relation_name MODIFY (field_1 newdata_type(Size), field_2 newdata_type(Size), .. field_newdata_type(Size));

Example: ALTER TABLE student MODIFY (fname VARCHAR(10), class VARCHAR(5));

c) **ALTER TABLE..DROP** This is used to remove any field of existing relations.

Syntax: ALTER TABLE relation_name DROP COLUMN (field_name);

Example: ALTER TABLE student DROP column (sname);

d) **ALTER TABLE..RENAME...:** This is used to change the name of fields in existing relations.

Syntax: ALTER TABLE relation_name RENAME COLUMN (OLD field_name) to (NEW field_name);

Example: ALTER TABLE student RENAME COLUMN sname to stu_name;

3. RENAME: It is used to modify the name of the existing database object.

Syntax: RENAME TABLE old_relation_name TO new_relation_name;

Example: RENAME TABLE studentd TO studentd1;

4. TRUNCATE and DROP

Difference between Truncate & Drop:-

TRUNCATE: This command will remove the data permanently. But structure will not be removed.

DROP: This command will delete the table data and structure permanently.

Syntax: TRUNCATE TABLE <Table name>

Example TRUNCATE TABLE student;

Syntax: DROP TABLE <Table name>

Example DROP TABLE student;

Data Control Language(DCL) : This is used to control privilege in Database. To perform any operation in the database, such as for creating tables, sequences or views we need privileges.

DCL defines two commands,

- **Grant** : Gives user access privileges to database.
- **Revoke** : Take back permissions from user.

Syntax: GRANT privilege_name ON object_name
TO {user_name };

Example : GRANT CREATE TABLE TO user1;

REVOKE privilege_name
ON object_name
FROM {user_name };

Example : REVOKE CREATE TABLE FROM user1;

LAB PRACTICE ASSIGNMENT:

Consider the following table structures for this assignment:

Table Name 1: **CUSTOMER**

Fields:

Cust_id varchar(10) Primary Key, C_name Varchar(15) Not NULL, City varchar(10).

Table Name 2: **BRANCH**

Fields:

Branch_id Varchar(5) Primary Key, bname Varchar (15), City varchar(10).

Table Name 3: **DEPOSIT**

Fields:

Acc_no varchar(10) Primary Key, Cust_id Varchar(10) Not NULL, Amount
int, Branch_id Varchar(5), Open_date date.

Table Name 4: **BORROW**

Fields:

Loan_no Varchar(5) Primary Key, Cust_id Varchar (10), Branch_id varchar(5),
Amount int.

Perform the following command/operation on the above table:

- 1) Create a Database
- 2) Show Database
- 3) Use Database
- 4) Drop Database
- 5) Create tables and Describe that Tables
- 6) Alter Command
 - i) Add column address to Customer table
 - ii) Modify any column
 - iii) Rename column address to new_address
 - iv) Drop column address from Customer table
 - v) Rename table Branch to Branch1
- 6) Perform DCL Commands Grant and Revoke on Customer table
- 7) Truncate table
- 8) Drop table

OUTPUT

1) **Create a Database**

```
mysql> CREATE DATABASE databasel;
Query OK, 1 row affected (0.02 sec)
```

2) **Show Database**

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| databasel |
| information_schema |
| mysql |
| performance_schema |
| sys |
+-----+
5 rows in set (0.02 sec)
```

3) **Use Database**

```
mysql> USE databasel;
Database changed
```

4) **Drop Database**

```
mysql> DROP DATABASE databasel;
Query OK, 0 rows affected (0.02 sec)
```

5) **Create tables and Describe that Tables**

```
mysql> CREATE TABLE Student(Roll_no INT NOT NULL PRIMARY KEY, Fname VARCHAR(100)
NOT NULL, Surname VARCHAR(100) NOT NULL);
Query OK, 0 rows affected (0.07 sec)
```

```
mysql> SHOW TABLES;
```

```
+-----+
| Tables_in_databasel |
+-----+
| Student |
+-----+
1 row in set (0.00 sec)
```

```
mysql> DESCRIBE Student;
```

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Fname	varchar(100)	NO		NULL	
Surname	varchar(100)	NO		NULL	

3 rows in set (0.01 sec)

```
mysql> ALTER TABLE Student ADD (Address CHAR(10));
Query OK, 0 rows affected (0.05 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

```
mysql> DESCRIBE Student;
```

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Fname	varchar(100)	NO		NULL	
Surname	varchar(100)	NO		NULL	
Address	char(10)	YES		NULL	

4 rows in set (0.00 sec)

```
mysql> ALTER TABLE Student MODIFY Fname VARCHAR(10);
Query OK, 0 rows affected (0.14 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

```
mysql> DESCRIBE Student;
```

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Fname	varchar(10)	YES		NULL	
Surname	varchar(100)	NO		NULL	
Address	char(10)	YES		NULL	

4 rows in set (0.00 sec)

```
mysql> ALTER TABLE Student DROP COLUMN Surname;
Query OK, 0 rows affected (0.05 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

```
mysql> DESCRIBE Student;
```

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Fname	varchar(10)	YES		NULL	
Address	char(10)	YES		NULL	

3 rows in set (0.00 sec)

6) Alter Command

6.i. Add column address to Customer table

```
mysql> CREATE TABLE CUSTOMER(Cust_id VARCHAR(10) PRIMARY KEY, C_name VARCHAR(15)
NOT NULL, City VARCHAR(10));
Query OK, 0 rows affected (0.06 sec)
```

```
mysql> DESCRIBE CUSTOMER;
```

Field	Type	Null	Key	Default	Extra
Cust_id	varchar(10)	NO	PRI	NULL	
C_name	varchar(15)	NO		NULL	
City	varchar(10)	YES		NULL	

3 rows in set (0.01 sec)

```
mysql> ALTER TABLE CUSTOMER ADD C_Address VARCHAR(30);
Query OK, 0 rows affected (0.04 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

```
mysql> DESCRIBE CUSTOMER;
```

Field	Type	Null	Key	Default	Extra
Cust_id	varchar(10)	NO	PRI	NULL	
C_name	varchar(15)	NO		NULL	
City	varchar(10)	YES		NULL	
C_Address	varchar(30)	YES		NULL	

4 rows in set (0.01 sec)

6.ii. Modify any column

```
mysql> ALTER TABLE Student MODIFY Fname VARCHAR(10);
Query OK, 0 rows affected (0.14 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

```
mysql> DESCRIBE Student;
```

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Fname	varchar(10)	YES		NULL	
Surname	varchar(100)	NO		NULL	
Address	char(10)	YES		NULL	

4 rows in set (0.00 sec)

6.iii. Rename column address to new_address

mysql> ALTER TABLE Student RENAME COLUMN fname TO Stu_name;
Query OK, 0 rows affected (0.05 sec)
Records: 0 Duplicates: 0 Warnings: 0

mysql> DESCRIBE Student;

Field	Type	Null	Key	Default	Extra
Roll_no	int	NO	PRI	NULL	
Stu_name	varchar(10)	YES		NULL	
Address	char(10)	YES		NULL	

3 rows in set (0.01 sec)

6.iv. Drop column address from Customer table

mysql> CREATE TABLE CUSTOMER(Cust_id VARCHAR(10) PRIMARY KEY, C_name VARCHAR(15) NOT NULL, City VARCHAR(10), C_Address VARCHAR(30));
Query OK, 0 rows affected (0.06 sec)

mysql> DESCRIBE CUSTOMER;

Field	Type	Null	Key	Default	Extra
Cust_id	varchar(10)	NO	PRI	NULL	
C_name	varchar(15)	NO		NULL	
City	varchar(10)	YES		NULL	
C_Address	varchar(30)	YES		NULL	

4 rows in set (0.00 sec)

mysql> ALTER TABLE CUSTOMER DROP COLUMN C_Address;
Query OK, 0 rows affected (0.04 sec)
Records: 0 Duplicates: 0 Warnings: 0

mysql> DESCRIBE CUSTOMER;

Field	Type	Null	Key	Default	Extra
Cust_id	varchar(10)	NO	PRI	NULL	
C_name	varchar(15)	NO		NULL	
City	varchar(10)	YES		NULL	

3 rows in set (0.00 sec)

6.v. Rename table Branch to Branch1

mysql> CREATE TABLE BRANCH(Branch_id VARCHAR(5) PRIMARY KEY, B_name VARCHAR(15), City VARCHAR(10));
Query OK, 0 rows affected (0.07 sec)

mysql> SHOW TABLES;

Tables_in_database1
BRANCH
CUSTOMER
Student

3 rows in set (0.01 sec)

```
mysql> ALTER TABLE BRANCH RENAME TO BRANCH1;
Query OK, 0 rows affected (0.04 sec)
```

```
mysql> SHOW TABLES;
+-----+
| Tables_in_databasel |
+-----+
| BRANCH1              |
| CUSTOMER             |
| Student              |
+-----+
3 rows in set (0.01 sec)
```

7) **Perform DCL Commands Grant and Revoke on Customer table**

7.i. Grant : Gives user access privileges to database.

```
sudo mysql -u root;
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 19
Server version: 8.0.33-0ubuntu0.22.04.2 (Ubuntu)
```

Copyright (c) 2000, 2023, Oracle and/or its affiliates.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

```
mysql> USE databasel;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
```

Database changed

```
mysql> CREATE USER user1 IDENTIFIED BY 'abc123';
Query OK, 0 rows affected (0.04 sec)
```

```
mysql> GRANT ALL ON CUSTOMER TO user1;
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> EXIT
Bye
```

```
sudo mysql -u user1 -p;
Enter password: abc123
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 21
Server version: 8.0.33-0ubuntu0.22.04.2 (Ubuntu)
```

Copyright (c) 2000, 2023, Oracle and/or its affiliates.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| databasel |
| information_schema |
| performance_schema |
+-----+
```

3 rows in set (0.00 sec)

- mysql> USE databasel;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed

```
mysql> SHOW TABLES;
+-----+
| Tables_in_databasel |
+-----+
| CUSTOMER             |
+-----+
1 row in set (0.00 sec)
```

- mysql> EXIT
Bye

7.ii. Revoke : Take back permissions from user.

- sudo mysql -u root;
- mysql> USE databasel;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed

```
mysql> REVOKE ALL ON CUSTOMER FROM user1;
Query OK, 0 rows affected (0.02 sec)
```

- mysql> EXIT
Bye

```
sudo mysql -u user1 -p;
Enter password: abc123
```

- mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| performance_schema |
+-----+
2 rows in set (0.00 sec)
- mysql> EXIT
Bye

8) **Truncate table**

- mysql> USE databasel;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
Database changed

```
mysql> TRUNCATE TABLE BRANCH1;
Query OK, 0 rows affected (0.08 sec)
```

- mysql> SHOW TABLES;
+-----+
| Tables_in_databasel |
+-----+
| BRANCH1 |
| CUSTOMER |
| Student |
+-----+
3 rows in set (0.00 sec)

```
mysql> DESCRIBE BRANCH1;
```

Field	Type	Null	Key	Default	Extra
Branch_id	varchar(5)	NO	PRI	NULL	
B_name	varchar(15)	YES		NULL	
City	varchar(10)	YES		NULL	

3 rows in set (0.01 sec)

- mysql> SELECT *FROM BRANCH1;
Empty set (0.00 sec)

□ mysql> INSERT INTO BRANCH1 VALUES(1,'CANARA','KOZHIKODE'), (2,'FEDERAL','IDUKKI');
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

- mysql> SELECT *FROM BRANCH1;

Branch_id	B_name	City
1	CANARA	KOZHIKODE
2	FEDERAL	IDUKKI

2 rows in set (0.01 sec)

- mysql> TRUNCATE TABLE BRANCH1;
Query OK, 0 rows affected (0.08 sec)

- mysql> SELECT *FROM BRANCH1;
Empty set (0.00 sec)

- mysql> DESCRIBE BRANCH1;

Field	Type	Null	Key	Default	Extra
Branch_id	varchar(5)	NO	PRI	NULL	
B_name	varchar(15)	YES		NULL	
City	varchar(10)	YES		NULL	

3 rows in set (0.01 sec)

9) **Drop table**

- mysql> SHOW TABLES;

Tables_in_database1
BRANCH1
CUSTOMER
Student

3 rows in set (0.00 sec)

- mysql> DROP TABLE CUSTOMER;

- mysql> SHOW TABLES;

Tables_in_database1
BRANCH1
Student

2 rows in set (0.00 sec)

Result: The program is executed successfully and the output is obtained.

Experiment No: 3

Aim :

Design and implement a database and apply at least 10 different DML queries for the following task. For a given input string display only those records which match the given pattern or a phrase in the search string. Make use of wild characters and LIKE operator for the same. Make use of Boolean and arithmetic operators wherever necessary.

Objective :

- To understand the different issues involved in the design and implementation of a database system
- To understand and use Data Manipulation Language to query to manage a database

Theory :

DATA MANIPULATION LANGUAGE (DML): The Data Manipulation Language (DML) is used to retrieve, insert and modify database information. These commands will be used by all database users during the routine operation of the database. Let's take a brief look at the basic DML commands:

- ❑ SELECT – retrieve data from the a database
- ❑ INSERT – insert data into a table
- ❑ UPDATE – updates existing data within a table
- ❑ DELETE – deletes all records from a table

1. **INSERT INTO:** This is used to add records into a relation. These are three type of INSERT INTO queries which are as

a) Inserting a single record

Syntax: INSERT INTO < relation/table name> (**field_1,field_2.....field_n**)VALUES
(data_1,data_2,..... data_n);

Example: INSERT INTO student(sno,sname,address)VALUES
(1,'Ravi','M.Tech','Palakol');

b) To insert multiple record

Here, we are going to insert record in the "cus_tbl" table of "customers" database. INSERT INTO student

```
(cus_id, cus_firstname, cus_surname)
VALUES
(5, 'Ajeet', 'Maurya'),
(6, 'Deepika', 'Chopra'),
(7, 'Vimal', 'Jaiswal');
table(column1,column2 ..)
VLUES (value1,
```

2. SELECT: This is used to Retrieve data from one or more tables.

a) SELECT FROM: To display all fields for all records.

Syntax : SELECT * FROM relation_name;

Example : SQL> select * from dept;

DEPTNO	DNAME	LOC
-----	-----	-----
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO
40	OPERATIONS	BOSTON

b) SELECT - FROM -WHERE: This query is used to display a selected set of fields for a selected set of records of a relation.

Syntax: SELECT a set of fields FROM relation_name WHERE condition;

Example: SQL> select * FROM dept WHERE deptno<=20;

DEPTNO	DNAME	LOC
-----	-----	-----
10	ACCOUNTING	NEW YORK
	RESEARC	
20	H	DALLAS

c) SELECT - FROM -WHERE- LIKE

The LIKE operator is used in a WHERE clause to search for a specified pattern in a column.

There are two wildcards used in conjunction with the LIKE operator:

- % - The percent sign represents zero, one, or multiple characters
- _ - The underscore represents a single character

Syntax: SELECT column1, column2, ...
FROM table_name
WHERE columnN LIKE pattern;

Example: SELECT * FROM Customers
WHERE CustomerName LIKE 'a%';

LIKE Operator

Description

WHERE CustomerName LIKE 'a%' Finds any values that starts with "a"

WHERE CustomerName LIKE '%a' Finds any values that ends with "a"

WHERE CustomerName LIKE '%or%' Finds any values that have "or" in any position

WHERE CustomerName LIKE '_r%' Finds any values that have "r" in the second position

WHERE CustomerName LIKE 'a_%_%' Finds any values that starts with "a" and are at least 3 characters in length

WHERE ContactName LIKE 'a%o' Finds any values that starts with "a" and ends with "o"

d) SELECT - DISTINCT

The SELECT DISTINCT statement is used to return only distinct (different) values. Inside a table, a column often contains many duplicate values; and sometimes you only want to list the different (distinct) values. The SELECT DISTINCT statement is used to return only distinct (different) values.

Syntax: SELECT DISTINCT *column1*, *column2*, ...
FROM *table_name*;

Example: SELECT COUNT(DISTINCT Country) FROM Customers;

e) SELECT - BETWEEN

The BETWEEN operator selects values within a given range. The values can be numbers, text, or dates.

The BETWEEN operator is inclusive: begin and end values are included.

Syntax: SELECT *column_name(s)*
FROM *table_name*
WHERE *column_name* BETWEEN *value1* AND *value2*;

Example: SELECT * FROM Products
WHERE Price BETWEEN 10 AND 20;

f) WHERE with - AND LOGICAL Operator

The WHERE clause when used together with the AND logical operator, is only executed if ALL filter criteria specified are met.

```
SELECT * FROM `movies` WHERE `category_id` = 2 AND `year_released` = 2008;
```

g) WHERE with - OR LOGICAL Operator

The WHERE clause when used together with the OR operator, is only executed if any or the entire specified filter criteria is met.

The following script gets all the movies in either category 1 or category 2

```
SELECT * FROM `movies` WHERE `category_id` = 1 OR `category_id` = 2;
```

h) WHERE with - Arithmetic Operator

Operator	Description	Example
=	Checks if the values of the two operands are equal or not, if yes, then the condition becomes true.	(A = B) is not true.

!=	Checks if the values of the two operands are equal or not, if the values are not equal then the condition becomes true.	(A != B) is true.
>	Checks if the value of the left operand is greater than the value of the right operand, if yes, then the condition becomes true.	(A > B) is not true.
<	Checks if the value of the left operand is less than the value of the right operand, if yes then the condition becomes true.	(A < B) is true.
>=	Checks if the value of the left operand is greater than or equal to the value of the right operand, if yes, then the condition becomes true.	(A >= B) is not true.
<=	Checks if the value of the left operand is less than or equal to the value of the right operand, if yes, then the condition becomes true.	(A <= B) is true.

Example: SELECT agent_code agent_name,
working_area, (commission*2)
FROM agents
WHERE (commission*2)>0.25;

3. **UPDATE-SET-WHERE:** This is used to update the content of a record in a relation.

Syntax: UPDATE relation name SET Field_name1=data,field_name2=data,

WHERE field_name=data;

Example: UPDATE student SET sname = 'kumar' WHERE sno=1;

4. **DELETE-FROM:** This is used to delete all the records of a relation but it will retain the structure of that relation.

a) **DELETE-FROM:** This is used to delete all the records of relation.

Syntax: DELETE FROM relation_name;

Example: DELETE FROM std;

b) **DELETE -FROM-WHERE:** This is used to delete a selected record from a relation.

Syntax: DELETE FROM relation_name WHERE condition;

Example: DELETE FROM student WHERE sno = 2;

LAB PRACTICE ASSIGNMENT:

Consider the following table structure for this assignment:

CUSTOMER(Cust_id, C_name, City)

BRANCH(Branch_id, bname, City)

DEPOSIT(Acc_no , Cust_id, Amount, Branch_id, Open_date)

BORROW(Loan_no, Cust_id, Branch_id, Amount)

Perform the following queries on the above table:

1. Insert minimum 10 rows on each table and display that data.
2. List Cust_id along with customer name.
3. List Cust_id of customers having amount greater than 10000.
4. List account date of customer 'Anil'.
5. List Cust_id of customers who have opened account after 01/01/2016.
6. List account no. and Cust_id of customers having amount between 40,000 and 80,000.
7. List customer name starting with 'S'.
8. List customer from depositor starting with '_a%'.
9. List customer name, account no and amount from deposit having exactly 5 characters in name.
10. List Cust_id, Loan no and Loan amount of borrowers.
11. List cust_id and C_name of depositors.
12. List all the customers who are depositors but not borrowers.
13. List all the customers who are both depositors and borrowers.
14. List all the customers along with their amount who are either borrowers.
15. List the cities of depositor having branch 'Cherthala'.
16. Update 10% interest to all depositors.
17. Update 10% to all depositors living in 'Ernakulam'.
18. Change living city of the 'Aroor' branch borrowers to Aroor.
19. Delete branches having deposit from Kollam.
20. Delete depositors of branches having number of customers between 1 and 3.
21. Delete depositors having deposit less than Rs500.

OUTPUT

1) *Insert minimum 10 rows on each table and display that data*

- mysql> CREATE DATABASE database2;
Query OK, 1 row affected (0.01 sec)
- mysql> USE database2;
Database changed

8 rows in set (0.00 sec)

Result: The program is executed successfully and the output is obtained.

Experiment No: 4

Aim: Execute the aggregate functions like count, sum, avg etc. on the suitable database. Make use of built in functions according to the need of the database chosen. Retrieve the data from the database based on time and date functions like now (), date (), day (), time () etc. Use group by and having clauses.

Objective:

- To understand and implement various types of function in MYSQL.
- To learn the concept of group functions

NUMBER FUNCTION:

Abs(n) :Select abs(-15) from dual;

Exp(n): Select exp(4) from dual;

Power(m,n): Select power(4,2) from dual;

Mod(m,n): Select mod(10,3) from dual;

Round(m,n): Select round(100.256,2) from dual;

Trunc(m,n): ;Select trunc(100.256,2) from dual;

Sqrt(m,n);Select sqrt(16) from dual;

Aggregate Functions:

1. Count: COUNT following by a column name returns the count of tuple in that column. If DISTINCT keyword is used then it will return only the count of unique tuple in the column. Otherwise, it will return count of all the tuples (including duplicates) count (*) indicates all the tuples of the column.

Syntax: COUNT (Column name)

Example: SELECT COUNT (Sal) FROM emp;

2. SUM: SUM followed by a column name returns the sum of all the values in that column. **Syntax:** SUM (Column name)

Example: SELECT SUM (Sal) From emp;

3. AVG: AVG followed by a column name returns the average value of that column values. **Syntax:** AVG (n1, n2...)

Example: Select AVG (10, 15, 30) FROM DUAL;

4. MAX: MAX followed by a column name returns the maximum value of that column. **Syntax:** MAX (Column name)

Example: SELECT MAX (Sal) FROM emp;

mysql> select deptno, max(sal) from emp group by deptno;

20 3000

302850

101300

[illegible]

```
.....+
1 row in set (0.00 sec)
```

DAY(date)
DAY() is a synonym for DAYOFMONTH().

DAYNAME(date)
Returns the name of the weekday for date.

```
mysql> SELECT DAYNAME('1998-02-05');
```

```
-----+
| DAYNAME('1998-02-05') |
```

```
-+
| Thursday |
```

```
-----+
1 row in set (0.00 sec)
```

HOUR(time)
Returns the hour for the time. The range of the return value is 0 to 23 for time-of-day values. However, the range of TIME values actually is much larger, so HOUR can return values greater than 23.

```
mysql> SELECT HOUR('10:05:03');
```

```
mysql> SELECT MINUTE('98-02-03 10:05:03');
```

```
-----  
-----  
-----

```

```
      --+                               +  
|      MINUTE('98-02-03 10:05:03')      |
```

```
-----  
-----
```

```
-----  
-----
```

```
      --+                               +  
|              5              |
```

```
-----  
-----  
-----  
-----  
-----
```

```
      --+                               +
```

1 row in set (0.00 sec)

MONTH(date)

Returns the month for date, in the range 0 to 12.

```
mysql> SELECT MONTH('1998-02-03')
```

```
-----  
-----  
-----
```

```
-----+                               +  
|      MONTH('1998-02-03')      |
```

```
-----  
-----  
-----
```

```
-----+                               +  
|              2              |
```

```
-----  
-----
```

```
-----+                               +
```

1 row in set (0.00 sec)

MONTHNAME(date)

Returns the full name of the month for date.

```
mysql> SELECT MONTHNAME('1998-02-05');
```

-----+	+
	MONTHNAME('1998-02-05')

-----+	+
	February

1 row in set (0.00 sec)

NOW()

Returns the current date and time as a value in 'YYYY-MM-DD HH:MM:SS' or YYYYMMDDHHMMSS format, depending on whether the function is used in a string or numeric context. The value is expressed in the current time zone.

```
mysql> SELECT NOW();
```

-----+	+
	NOW()

	1997-12-15 23:50:26

1 row in set (0.00 sec)

GROUP BY: This query is used to group to all the records in a relation together for each and every value of a specific key(s) and then display them for a selected set of fields the relation.

Syntax: SELECT <set of fields> FROM <relation_name>

GROUP BY <field_name>;

Example: SELECT EMPNO, SUM (SALARY) FROM EMP GROUP BY
EMPNO;

GROUP BY-HAVING : The HAVING clause was added to SQL because the WHERE keyword could not be used with aggregate functions. The HAVING clause must follow the GROUP BY clause in a query and must also precede the ORDER BY clause if used.

Syntax: SELECT column_name, aggregate_function(column_name) FROM table_name
WHERE column_name operator value

GROUP BY column_name

HAVING aggregate_function(column_name) operator value;

Example : SELECT empno,SUM(SALARY) FROM emp,dept

WHERE emp.deptno =20 GROUP BY empno;

ORDER BY: This query is used to display a selected set of fields from a relation in an ordered manner base on some field.

Syntax: SELECT <set of fields> FROM <relation_name>

ORDER BY <field_name>;

Example: SQL> SELECT empno, ename, job FROM emp ORDER BY job;

LAB PRACTICE ASSIGNMENT:

Consider the following table structure for this assignment:

CUSTOMER(Cust_id, C_name, City)

BRANCH(Branch_id, bname, City)

DEPOSIT(Acc_no , Cust_id, Amount, Branch_id, Open_date)

BORROW(Loan_no, Cust_id, Branch_id, Amount)

Perform the following queries on the above table:

- 1) List total loan.
- 2) List total deposit.
- 3) List maximum deposit of customers living in Ernakulam.
- 4) Count total number of branch cities.
- 5) List branch_id and branch wise deposit.
- 6) List the branches having sum of deposit more than 4000.
- 7) List the names of customers having minimum deposit.
- 8) Count the number of depositors living in 'Cherthala'.
- 9) Find the maximum deposit of the Alappuzha branch.
- 10) Find out number of customers living in Ernakulam.
- 11) Find out the customers who are not living in Ernakulam or Alappuzha.
- 12) List out Cust_id and C_name in descending order of their C_name.
- 13) Display the number of depositors in branch wise.
- 14) Find out the branch which has not borrowers.
- 15) How many customers have opened deposit after '01-01-2016'

OUTPUT

Consider the following table structure for this assignment:

- `mysql> CREATE DATABASE database3;`
Query OK, 1 row affected (0.02 sec)
- `mysql> USE database3;`
Database changed
- `mysql> CREATE TABLE CUSTOMER(Cust_id INT PRIMARY KEY,C_name VARCHAR(15),City VARCHAR(20));`
Query OK, 0 rows affected (0.06 sec)
- `mysql> INSERT INTO CUSTOMER(Cust_id, C_name, City) VALUES(1,"Adarsh","Kozhikode"),`
(2,"Abhishek","Truvandrum"), (3,"Akshay","Palakkad"), (4,"Sooraj","Truvandrum"),
(5,"Sanjay","Malappuram"), (6,"Fazil","Kozhikode"), (7,"Arjun","Kozhikode"),
(8,"Anil","Idukki"), (9,"Ragesh","Eranakulam"), (10,"Reno","Eranakulam");
Query OK, 10 rows affected (0.01 sec)
Records: 10 Duplicates: 0 Warnings: 0
- `mysql> CREATE TABLE BRANCH(Branch_id INT PRIMARY KEY,B_name VARCHAR(25),City VARCHAR(20));`
Query OK, 0 rows affected (0.07 sec)
- `mysql> INSERT INTO BRANCH(Branch_id, B_name, City) VALUES(1,"Alappuza","Kochi"),`
(2,"Punjab National Bank","Punjab"), (4,"Bank of Baroda","Bangal"), (7,"Canara
Bank","Kadalundi"), (6,"Union Bank of India","Odisha"), (5,"Bank of
India","Karnataka"), (14,"Aroor","Vaikom"), (12,"Cherthala","Pallipuram"), (8,"UCO
Bank","Kollam"), (9,"Indian Bank","Kerala");
Query OK, 10 rows affected (0.02 sec)
Records: 10 Duplicates: 0 Warnings: 0
- `mysql> CREATE TABLE DEPOSIT(Acc_no VARCHAR(15), Cust_id INT, Amount INT, Branch_id INT, Open_date DATE, FOREIGN KEY (Cust_id) REFERENCES CUSTOMER (Cust_id), FOREIGN KEY (Branch_id) REFERENCES BRANCH (Branch_id));`
Query OK, 0 rows affected (0.10 sec)
- `mysql> INSERT INTO DEPOSIT (Acc_no, Cust_id, Amount, Branch_id, Open_date)`

5	50000
6	31000
8	6300
9	56600
12	8000

8 rows in set (0.01 sec)

8) List the names of customers having minimum deposit

```
mysql> SELECT C_name FROM CUSTOMER WHERE Cust_id IN (SELECT Cust_id FROM DEPOSIT GROUP BY Cust_id HAVING MIN(Amount) = (SELECT MIN(Amount) FROM DEPOSIT));
```

C_name
Fazil

1 row in set (0.01 sec)

9) Count the number of depositors living in 'Kozhikode'

```
mysql> SELECT COUNT(DISTINCT Cust_id) AS DepositorsCount FROM DEPOSIT WHERE Cust_id IN (SELECT Cust_id FROM CUSTOMER WHERE City = 'Kozhikode');
```

DepositorsCount
3

1 row in set (0.00 sec)

10) Find the maximum deposit of the Kerala branch

```
mysql> SELECT MAX(Amount) AS MaxDeposit FROM DEPOSIT WHERE Branch_id IN (SELECT Branch_id FROM BRANCH WHERE City = 'Kerala');
```

MaxDeposit
56600

1 row in set (0.00 sec)

11) Find out number of customers living in Ernakulam

```
mysql> SELECT COUNT(*) AS CustomerCount FROM CUSTOMER WHERE City = 'Ernakulam';
```

CustomerCount
2

1 row in set (0.00 sec)

12) Find out the customers who are not living in Ernakulam or Alappuzha

```
mysql> SELECT * FROM CUSTOMER WHERE City NOT IN ('Ernakulam', 'Alappuzha');
```

Cust_id	C_name	City
1	Adarsh	Kozhikode
2	Abhishek	Truvandrum
3	Akshay	Palakkad
4	Sooraj	Truvandrum
5	Sanjay	Malappuram
6	Fazil	Kozhikode
7	Arjun	Kozhikode
8	Anil	Idukki

8 rows in set (0.00 sec)

13) List out Cust_id and C_name in descending order of their C_name

```
mysql> SELECT Cust_id, C_name FROM CUSTOMER ORDER BY C_name DESC;
```

Cust_id	C_name
4	Sooraj
5	Sanjay
10	Reno
9	Ragesh
6	Fazil
7	Arjun
8	Anil
3	Akshay
1	Adarsh
2	Abhishek

10 rows in set (0.00 sec)

14) Display the number of depositors in branch wise

```
mysql> SELECT Branch_id, COUNT(DISTINCT Cust_id) AS DepositorsCount FROM DEPOSIT  
GROUP BY Branch_id;
```

Branch_id	DepositorsCount
1	1
2	1
4	1
5	1
6	1
7	1
8	1
9	1
12	1
14	1

10 rows in set (0.00 sec)

15) Find out the branch which has not borrowers

```
mysql> SELECT * FROM BRANCH WHERE Branch_id NOT IN (SELECT DISTINCT Branch_id FROM  
BORROW);
```

Branch_id	B_name	City
5	Bank of India	Karnadaka

1 row in set (0.01 sec)

Result: The program is executed successfully and the output is obtained.

Experiment No: 5

Aim: Implement nested sub queries. Perform a test for set membership (in, not in), set comparison (<some, >=some, <all etc.) and set cardinality (unique, not unique).

Objective:

- To learn different types of Joins.
- To implement different sub queries.

Theory :

MySQL JOINS are used with SELECT statement. It is used to retrieve data from multiple tables. It is performed whenever you need to fetch records from two or more tables.

There are three types of MySQL joins:

- MySQL INNER JOIN (or sometimes called simple join)
- MySQL LEFT OUTER JOIN (or sometimes called LEFT JOIN)
- MySQL RIGHT OUTER JOIN (or sometimes called RIGHT JOIN)

MySQL Inner JOIN (Simple Join)

The MySQL INNER JOIN is used to return all rows from multiple tables where the join condition is satisfied. It is the most common type of join.

Syntax:

```
SELECT columns  
FROM table1  
  
INNER JOIN table2  
ON table1.column = table2.column;
```

Image representation:

Let's take an example:

Consider two tables "officers" and "students", having the following data.

Execute the following query:

```
SELECT officers.officer_name, officers.address, students.course_name
FROM officers
INNER JOIN students
ON officers.officer_id = students.student_id;
```

MySQL Left Outer Join

The LEFT OUTER JOIN returns all rows from the left hand table specified in the ON condition and only those rows from the other table where the join condition is fulfilled.

Syntax:

```
SELECT columns
FROM table1
LEFT [OUTER] JOIN table2
ON table1.column = table2.column;
```

Image representation:

Let's take an example:

Consider two tables "officers" and "students", having the following data.

Execute the following query:

```
SELECT officers.officer_name, officers.address, students.course_name
FROM officers
LEFT JOIN students
ON officers.officer_id = students.student_id;
```

MySQL Right Outer Join

The MySQL Right Outer Join returns all rows from the RIGHT-hand table specified in the ON condition and only those rows from the other table where the join condition is fulfilled.

Syntax:

```
SELECT columns
FROM table1
RIGHT [OUTER] JOIN table2
ON table1.column = table2.column;
```

Image representation:**Let's take an example:**

Consider two tables "officers" and "students", having the following data.

Execute the following query:

```
SELECT      officers.officer_name,      officers.address,
            students.course_name,
            students.student_name
FROM officers
RIGHT JOIN students
ON officers.officer_id = students.student_id;
```

SPECIAL OPERATOR:**MySQL IN Condition**

The MySQL IN condition is used to reduce the use of multiple OR conditions in a SELECT, INSERT, UPDATE and DELETE statement.

Syntax:

expression IN (value1, value2, value_n);

Parameters:

expression: It specifies a value to test.

value1, value2, or value_n: These are the values to test against expression. If any of these values matches expression, then the IN condition will evaluate to true. This is a quick method to test if any one of the values matches expression.

Execute the following query:

```
SELECT *
```

```
FROM officers
```

```
WHERE officer_name IN ('Ajeet', 'Vimal', 'Deepika');
```

MySQL NOT Condition

The MySQL NOT condition is opposite of MySQL IN condition. It is used to negate a condition in a SELECT, INSERT, UPDATE or DELETE statement.

Syntax:

NOT condition

Parameter:

condition: It specifies the conditions that you want to negate.

MySQL NOT Operator with IN condition

Consider a table "officers", having the following data.

Execute the following query:

```
SELECT *
```

```
FROM officers
```

```
WHERE officer_name NOT IN ('Ajeet','Vimal','Deepika');
```

MySQL IS NULL Condition

MySQL IS NULL condition is used to check if there is a NULL value in the expression. It is used with SELECT, INSERT, UPDATE and DELETE statement.

Syntax:

expression IS NULL

Parameter:

expression: It specifies a value to test if it is NULL

Execute the following query:

```
SELECT *
```

```
FROM officers
```

```
WHERE officer_name IS NULL;
```

MySQL IS NOT NULL Condition

MySQL IS NOT NULL condition is used to check the NOT NULL value in the expression. It is used with SELECT, INSERT, UPDATE and DELETE statements.

Syntax:

expression IS NOT NULL

Parameter:

expression: It specifies a value to test if it is not NULL value.

Execute the following query:

```
SELECT *  
FROM officers  
WHERE officer_name IS NOT NULL;
```

SET OPERATORS:

The Set operator combines the result of 2 queries into a single result. The following are the operators:

- ☐ Union
- ☐ Union all
- ☐ Intersect
- ☐ Minus

Lab practice assignment

Consider the following table structure for this assignment:

- Location(Location_Id integer, Reginal_Group varchar(20))
- Department (Department_Id, Name, Location_Id)
- Job(Job_Id Integer,Function Varchar(30))
- Employee(Employee_Id, Lastname ,Firstname, Middlename, Job_Id, Manager_Id, Hiredate, Salary, Department_Id)
- Loan(Employee_Id, Firstname , Loan_Amount)

Perform the following queries on the above table:

- 1) Perform all types of JOIN operations on Employee and Loan tables.
- 2) Perform all types of set operations on Employee and Loan tables.
- 3) Find out no.of employees working in “Sales” department
- 4) Find out the employees who are not working in department 10 or 30.
- 5) List out employee id, last name in descending order based on the salary column.
- 6) How many employees who are working in different departments wise in the organization
- 7) List out the department id having at least four employees
- 8) Display the employee who got the maximum salary.
- 9) Update the employees’ salaries, who are working as Clerk on the basis of 10%.
- 10) Delete the employees who are working in accounting department.
- 11) Find out whose department has not employees.
- 12) List out the department wise maximum salary, minimum salary, average salary of the employees
- 13) How many employees who are joined in 1985.
- 14) Display the employees who are working in “New York”
- 15) List our employees with their department names

OUTPUT

801	Jayasurya	3000.00
901	Vineeth	1700.00
1001	Prithviraj	1900.00

10 rows in set (0.00 sec)

1) **Perform all types of JOIN operations on Employee and Loan tables**

■ a) Inner Join

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Loan.Loan_Amount
-> FROM Employee
-> INNER JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id;
```

Employee_Id	Lastname	Loan_Amount
101	Viswanathan	1000.00
201	Pillai	2000.00
301	Ali	1500.00
401	Ali	1200.00
501	Faasil	1800.00
601	Pauly	2500.00
701	Salmaan	2200.00
801	Ramasamy	3000.00
901	Kumar	1700.00
1001	Sukumaran	1900.00

10 rows in set (0.00 sec)

■ b) Left Join

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Loan.Loan_Amount
-> FROM Employee
-> LEFT JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id;
```

Employee_Id	Lastname	Loan_Amount
101	Viswanathan	1000.00
201	Pillai	2000.00
301	Ali	1500.00
401	Ali	1200.00
501	Faasil	1800.00
601	Pauly	2500.00
701	Salmaan	2200.00
801	Ramasamy	3000.00
901	Kumar	1700.00
1001	Sukumaran	1900.00

10 rows in set (0.00 sec)

■ c) Right Join

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Loan.Loan_Amount
-> FROM Employee
-> RIGHT JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id;
```

Employee_Id	Lastname	Loan_Amount
101	Viswanathan	1000.00
201	Pillai	2000.00
301	Ali	1500.00
401	Ali	1200.00
501	Faasil	1800.00
601	Pauly	2500.00
701	Salmaan	2200.00
801	Ramasamy	3000.00
901	Kumar	1700.00
1001	Sukumaran	1900.00

10 rows in set (0.00 sec)

■ d) Full Outer

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Loan.Loan_Amount
-> FROM Employee
-> LEFT JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id
-> UNION
-> SELECT Employee.Employee_Id, Employee.Lastname, Loan.Loan_Amount
-> FROM Employee
-> RIGHT JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id
-> WHERE Employee.Employee_Id IS NULL;
```

Employee_Id	Lastname	Loan_Amount
101	Viswanathan	1000.00
201	Pillai	2000.00
301	Ali	1500.00
401	Ali	1200.00
501	Faasil	1800.00
601	Pauly	2500.00
701	Salmaan	2200.00
801	Ramasamy	3000.00
901	Kumar	1700.00
1001	Sukumaran	1900.00

10 rows in set (0.01 sec)

2) **Perform all types of set operations on Employee and Loan tables**

■ a) Union

```
mysql> SELECT Employee_Id, Lastname, Firstname FROM Employee
-> UNION
-> SELECT Employee_Id, Firstname, NULL FROM Loan;
```

Employee_Id	Lastname	Firstname
101	Viswanathan	Mohanlal
201	Pillai	Dileep
301	Ali	Mammootty
401	Ali	Prithviraj
501	Faasil	Fahadh
601	Pauly	Nivin
701	Salmaan	Dulquer
801	Ramasamy	Jayasurya
901	Kumar	Vineeth
1001	Sukumaran	Prithviraj
101	Mohanlal	NULL
201	Dileep	NULL
301	Mammootty	NULL
401	Prithviraj	NULL
501	Fahadh	NULL
601	Nivin	NULL
701	Dulquer	NULL
801	Jayasurya	NULL
901	Vineeth	NULL
1001	Prithviraj	NULL

20 rows in set (0.00 sec)

■ b) Intersection

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Employee.Firstname
-> FROM Employee
-> INNER JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id;
```

Employee_Id	Lastname	Firstname
101	Viswanathan	Mohanlal
201	Pillai	Dileep
301	Ali	Mammootty
401	Ali	Prithviraj
501	Faasil	Fahadh
601	Pauly	Nivin
701	Salmaan	Dulquer
801	Ramasamy	Jayasurya
901	Kumar	Vineeth
1001	Sukumaran	Prithviraj

10 rows in set (0.00 sec)

■ c) Difference

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Employee.Firstname
-> FROM Employee
-> LEFT JOIN Loan ON Employee.Employee_Id = Loan.Employee_Id
-> WHERE Loan.Employee_Id IS NULL;
Empty set (0.00 sec)
```

3) **Find out no.of employees working in “Sales” department**

```
mysql> SELECT COUNT(*) AS EmployeeCount
-> FROM Employee
-> JOIN Department ON Employee.Department_Id = Department.Department_Id
-> WHERE Department.Name = 'Sales';
```

EmployeeCount
3

1 row in set (0.00 sec)

4) **Find out the employees who are not working in department 10 or 30**

```
mysql> SELECT Employee_Id, Lastname, Firstname
-> FROM Employee
-> WHERE Department_Id NOT IN (10, 30);
```

Employee_Id	Lastname	Firstname
301	Ali	Mammootty
401	Ali	Prithviraj
901	Kumar	Vineeth
801	Ramasamy	Jayasurya

4 rows in set (0.00 sec)

5) List out employee id, last name in descending order based on the salary column

```
mysql> SELECT Employee_Id, Lastname
-> FROM Employee
-> ORDER BY Salary DESC;
```

Employee_Id	Lastname
101	Viswanathan
201	Pillai
501	Faasil
801	Ramasamy
301	Ali
1001	Sukumaran
701	Salmaan
401	Ali
901	Kumar
601	Pauly

10 rows in set (0.00 sec)

6) How many employees who are working in different departments wise in the organization

```
mysql> SELECT Department.Name, COUNT(*) AS EmployeeCount
-> FROM Employee
-> JOIN Department ON Employee.Department_Id = Department.Department_Id
-> GROUP BY Department.Name;
```

Name	EmployeeCount
Sales	3
Marketing	3
Finance	3
Human Resources	1

4 rows in set (0.00 sec)

7) List out the department id having at least Two employees

```
mysql> SELECT Department_Id, COUNT(*) AS EmployeeCount
-> FROM Employee
-> GROUP BY Department_Id
-> HAVING COUNT(*) >= 2;
```

Department_Id	EmployeeCount
10	3
20	3
30	3

3 rows in set (0.01 sec)

8) Display the employee who got the maximum salary

```
mysql> SELECT Employee_Id, Lastname, Firstname, Salary
-> FROM Employee
-> WHERE Salary = (SELECT MAX(Salary) FROM Employee);
```

Employee_Id	Lastname	Firstname	Salary
101	Viswanathan	Mohanlal	5000.00

1 row in set (0.00 sec)

9) Update the employees' salaries, who are working as Clerk on the basis of 10%

```
mysql> UPDATE Employee
-> SET Salary = Salary * 1.1
-> WHERE Job_Id = (SELECT Job_Id FROM Job WHERE `Function` = 'Clerk');
```

Query OK, 0 rows affected (0.01 sec)
Rows matched: 0 Changed: 0 Warnings: 0

mysql> SELECT * FROM Employee;

Employee_Id	Lastname	Firstname	Middlename	Job_Id	Manager_Id	Hiredate	Salary	Department_Id
101	Viswanathan	Mohanlal	Gopalakrishnan	1	NULL	2021-01-01	5000.00	10
201	Pillai	Dileep	Kumar	2	101	2021-02-01	4500.00	10

601	Pauly	Nivin	Jacob	5	301	2021-06-01	3700.00	30
701	Salmaan	Dulquer	Salmaan	6	601	2021-07-01	3900.00	30
901	Kumar	Vineeth	Kumar	4	201	2021-09-01	3800.00	20
1001	Sukumaran	Prithviraj	Grace	6	501	2021-10-01	4000.00	30

9 rows in set (0.01 sec)

11) Find out whose department has not employees

```
mysql> SELECT Department.Department_Id, Department.Name
-> FROM Department
-> LEFT JOIN Employee ON Department.Department_Id = Employee.Department_Id
-> WHERE Employee.Employee_Id IS NULL;
```

Department_Id	Name
40	Human Resources
50	Operations
60	IT
70	Research and Development
80	Customer Service
90	Production
100	Quality Assurance

7 rows in set (0.01 sec)

12) List out the department wise maximum salary, minimum salary, average salary of the employees

```
mysql> SELECT Department.Department_Id, Department.Name, MAX(Employee.Salary) AS
MaxSalary, MIN(Employee.Salary) AS MinSalary, AVG(Employee.Salary) AS AvgSalary
-> FROM Department
-> JOIN Employee ON Department.Department_Id = Employee.Department_Id
-> GROUP BY Department.Department_Id, Department.Name;
```

Department_Id	Name	MaxSalary	MinSalary	AvgSalary
10	Sales	5000.00	4200.00	4566.666667
20	Marketing	4000.00	3800.00	3866.666667
30	Finance	4000.00	3700.00	3866.666667

3 rows in set (0.01 sec)

13) How many employees who are joined in 1985

```
mysql> SELECT COUNT(*) AS EmployeeCount
-> FROM Employee
-> WHERE YEAR(Hiredate) = 1985;
```

EmployeeCount
0

1 row in set (0.01 sec)

14) *Display the employees who are working in “Kollam”*

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Employee.Firstname FROM
Employee JOIN Department ON Employee.Department_Id = Department.Department_Id JOIN
Location ON Department.Location_Id = Location.Location_Id WHERE
Location.Regional_Group = 'Kollam';
```

Employee_Id	Lastname	Firstname
601	Pauly	Nivin
701	Salmaan	Dulquer
1001	Sukumaran	Prithviraj

3 rows in set (0.00 sec) 4 rows in set (0.00 sec)

15) *List our employees with their department names*

```
mysql> SELECT Employee.Employee_Id, Employee.Lastname, Employee.Firstname,
Department.Name
-> FROM Employee
-> JOIN Department ON Employee.Department_Id = Department.Department_Id;
```

Employee_Id	Lastname	Firstname	Name
101	Viswanathan	Mohanlal	Sales
201	Pillai	Dileep	Sales
301	Ali	Mammootty	Marketing
401	Ali	Prithviraj	Marketing
501	Faasil	Fahadh	Sales
601	Pauly	Nivin	Finance
701	Salmaan	Dulquer	Finance
901	Kumar	Vineeth	Marketing
1001	Sukumaran	Prithviraj	Finance

9 rows in set (0.00 sec)

Result: The program is executed successfully and the output is obtained.

Experiment No: 6

Aim: Execute DDL statements which demonstrate the use of views and Indexing. Try to update the base table using its corresponding view. Also consider restrictions on updatable views and perform view creation from multiple tables.

Objective:

- To study and implement views and Indexing in DDL.

Theory :

In MySQL, View is a virtual table created by a query by joining one or more tables.

MySQL Create VIEW

A VIEW is created by SELECT statements. SELECT statements are used to take data from the source table to make a VIEW.

Syntax:

```
CREATE [OR REPLACE] VIEW view_name AS
SELECT columns
FROM tables
[WHERE conditions];
```

Parameters:

OR REPLACE: It is optional. It is used when a VIEW already exist. If you do not specify this clause and the VIEW already exists, the CREATE VIEW statement will return an error.

view_name: It specifies the name of the VIEW that you want to create in MySQL.

WHERE conditions: It is also optional. It specifies the conditions that must be met for the records to be included in the VIEW.

The following example will create a VIEW name "trainer". This is a virtual table made by taking data from the table "courses".

```
CREATE VIEW trainer AS
SELECT course_name, course_trainer
FROM courses;
```

To see the created VIEW:

Syntax:

```
SELECT * FROM view_name;
```

Let's see how it looks the created VIEW:

```
SELECT * FROM trainer;
```

MySQL Update VIEW

In MYSQL, the ALTER VIEW statement is used to modify or update the already created VIEW without dropping it.

Syntax:

```
ALTER VIEW view_name AS
SELECT columns

FROM table
WHERE conditions;
```

Example: The following example will alter the already created VIEW name "trainer" by adding a new column.

```
ALTER VIEW trainer AS

SELECT course_name, course_trainer, course_id
FROM courses;
```

To see the altered VIEW:

```
SELECT*FROM trainer;
```

MySQL Drop VIEW

You can drop the VIEW by using the DROP VIEW statement.

Syntax:

```
DROP VIEW [IF EXISTS] view_name;
```

Parameters:

view_name: It specifies the name of the VIEW that you want to drop.

IF EXISTS: It is optional. If you do not specify this clause and the VIEW doesn't exist, the DROP VIEW statement will return an error.

Example:

```
DROP VIEW trainer;
```

Index

Indexes are used to retrieve data from the database more quickly than otherwise. The users cannot see the indexes, they are just used to speed up searches/queries

CREATE INDEX Syntax

CREATE INDEX *index_name* ON *table_name* (*column1*, *column2*, ...);

Example:

CREATE INDEX *idx_lastname* ON Persons (*LastName*);[Simple Indexing]

CREATE INDEX *idx_pname* ON Persons (*LastName*, *FirstName*);[Composite Indexing]

DROP INDEX Statement

ALTER TABLE *table_name* DROP INDEX *index_name*;

OUTPUT

- `mysql> CREATE DATABASE database5;`
Query OK, 1 row affected (0.02 sec)
- `mysql> USE database5`

Result: The program is executed successfully and the output is obtained.

PL/SQL

PL/SQL (Procedural Language/Structured Query Language) is Oracle Corporation's procedural extension for SQL and the Oracle relational database. PL/SQL includes procedural language elements such as conditions and loops. It allows declaration of constants and variables, procedures and functions, types and variables of those types, and triggers. It can handle exceptions (runtime errors). One can create PL/SQL units such as procedures, functions, packages, types, and triggers, which are stored in the database for reuse by applications that use any of the Oracle Database programmatic interfaces.

Basics of PL/SQL

- PL/SQL stands for Procedural Language extensions to the Structured Query Language (SQL).
- PL/SQL is a combination of SQL along with the procedural features of programming languages.
- Oracle uses a PL/SQL engine to process the PL/SQL statements.
- PL/SQL includes procedural language elements like conditions and loops. It allows declaration of constants and variables, procedures and functions, types and variable of those types and triggers.

Disadvantages of SQL:

- SQL doesn't provide the programmers with a technique of condition checking, looping and branching.
- SQL statements are passed to Oracle engine one at a time which increases traffic and decreases speed.
- SQL has no facility of error checking during manipulation of data.

Features of PL/SQL:

- PL/SQL is basically a procedural language, which provides the functionality of decision making, iteration and many more features of procedural programming languages.
- PL/SQL can execute a number of queries in one block using single command.
- One can create a PL/SQL unit such as procedures, functions, packages, triggers, and types, which are stored in the database for reuse by applications.
- PL/SQL provides a feature to handle the exception which occurs in PL/SQL block known as exception handling block.

- Applications written in PL/SQL are portable to computer hardware or operating system where Oracle is operational.
- PL/SQL Offers extensive error checking.

Differences between SQL and PL/SQL:

SQL	PL/SQL
SQL is a single query that is used to perform DML and DDL operations.	PL/SQL is a block of codes that used to write the entire program blocks/ procedure/ function, etc.
It is declarative, that defines what needs to be done, rather than how things need to be done.	PL/SQL is procedural that defines how the things needs to be done.
Execute as a single statement.	Execute as a whole block.
Mainly used to manipulate data.	Mainly used to create an application.
Cannot contain PL/SQL code in it.	It is an extension of SQL, so it can contain SQL inside it.

Structure of PL/SQL Block:

PL/SQL extends SQL by adding constructs found in procedural languages, resulting in a structural language that is more powerful than SQL. The basic unit in PL/SQL is a block. All PL/SQL programs are made up of blocks, which can be nested within each other.

Typically, each block performs a logical action in the program. A block has the following structure:

```

DECLARE
    declaration statements;
BEGIN
    executable statements

EXCEPTIONS
    exception handling statements

END
```

11 /

Enter value for a: 5

old 6: a:=&a;

new 6: a:=5;

Enter value for b: 6

old 7: b:=&b;

new 7: b:=6;

Sum is :11

PL/SQL procedure successfully completed

Result: The program executed successfully and the output is obtained.

2) **Aim: Program to find Factorial of a Number**

```
♦ SQL> DECLARE
  2  f NUMBER:=1;
  3  n NUMBER;
  4  i NUMBER;
  5  BEGIN
  6  n:=&n;
  7  FOR i IN 1..n
  8  LOOP
  9  f:=f*i;
 10  END LOOP;
 11  DBMS_OUTPUT.PUT_LINE('Factorial of '||n||' is '||f);
 12  END;
 13  /
```

```
Enter value for n: 5
old   6: n:=&n;
new   6: n:=5;
Factorial of 5 is 120
PL/SQL procedure successfully completed.
```

Result: The program executed successfully and the output is obtained.

3) **Aim: Program to find Reverse of a Number**

```
♦ SQL> DECLARE
  2  n NUMBER;
  3  rev_n NUMBER;
  4  BEGIN
  5  n:=&n;
  6  rev_n:=0;
  7  WHILE n>0 LOOP
  8  rev_n:=(rev_n*10)+MOD(n,10);
  9  n:=FLOOR(n/10);
 10  END LOOP;
 11  DBMS_OUTPUT.PUT_LINE('Reverse is '||rev_n);
 12  END;
 13  /
```

```
Enter value for n: 123
old   5: n:=&n;
new   5: n:=123;
Reverse is 321
PL/SQL procedure successfully completed.
```

Result: The program executed successfully and the output is obtained.

4) **Aim: Program to Check the Number is Palindrome or Not**

```
◆ SQL> DECLARE
  2  n NUMBER;
  3  rev_n NUMBER := 0;
  4  temp_n NUMBER;
  5  BEGIN
  6  n := &n;
  7  temp_n := n;
  8  WHILE temp_n > 0 LOOP
  9  rev_n := (rev_n * 10) + MOD(temp_n, 10);
10  temp_n := FLOOR(temp_n / 10);
11  END LOOP;
12  IF n = rev_n THEN
13  DBMS_OUTPUT.PUT_LINE('The number ' || n || ' is a palindrome.');
```

```
14  ELSE
15  DBMS_OUTPUT.PUT_LINE('The number ' || n || ' is not a palindrome.');
```

```
16  END IF;
```

```
17  END;
```

```
18  /
```

Enter value for n: 121

old 6: n := &n;

new 6: n := 121;

The number 121 is a palindrome.

PL/SQL procedure successfully completed.

Result: The program executed successfully and the output is obtained.

5) **Aim: Program to find Volume of cuboid**

```
◆ SQL> DECLARE
  2  a INTEGER;
  3  b INTEGER;
  4  c INTEGER;
  5  vol INTEGER;
  6  BEGIN
  7  a:=&a;
  8  b:=&b;
  9  c:=&c;
10  vol:=a*b*c;
11  DBMS_OUTPUT.PUT_LINE('Volume is ' || vol);
12  END;
```

```
13  /
```

Enter value for a: 2

old 7: a:=&a;

new 7: a:=2;

Enter value for b: 3

old 8: b:=&b;

new 8: b:=3;

Enter value for c: 4

old 9: c:=&c;

new 9: c:=4;

Volume is 24

PL/SQL procedure successfully completed.

Result: The program executed successfully and the output is obtained.

Stored procedure in PL/SQL

Experiment no.8

Aim: Write and execute PL/SQL stored procedure and function to perform a suitable task on the database. Demonstrate its use.

Objective:

- To study and implement PL/SQL procedure.
- To study and implement PL/SQL function.

Theory :

A **subprogram** is a program unit/module that performs a particular task. These subprograms are combined to form larger programs. This is basically called the 'Modular design'. A subprogram can be invoked by another subprogram or program which is called the **calling program**.

A subprogram can be created –

- At the schema level
- Inside a package
- Inside a PL/SQL block

At the schema level, subprogram is a **standalone subprogram**. It is created with the CREATE PROCEDURE or the CREATE FUNCTION statement. It is stored in the database and can be deleted with the DROP PROCEDURE or DROP FUNCTION statement.

PL/SQL subprograms are named PL/SQL blocks that can be invoked with a set of parameters. PL/SQL provides two kinds of subprograms –

- **Functions** – These subprograms return a single value; mainly used to compute and return a value.
- **Procedures** – These subprograms do not return a value directly; mainly used to perform an action.

Parts of a PL/SQL Subprogram

Each PL/SQL subprogram has a name, and may also have a parameter list. Like anonymous PL/SQL blocks, the named blocks will also have the following three parts –

S.No	Parts & Description
1	Declarative Part It is an optional part. However, the declarative part for a subprogram does not start with the DECLARE keyword. It contains declarations of types, cursors, constants, variables, exceptions, and nested subprograms. These items are local to the subprogram and cease to exist when the subprogram completes execution.

Creating a Procedure

A procedure is created with the **CREATE OR REPLACE PROCEDURE** statement. The simplified syntax for the CREATE OR REPLACE PROCEDURE statement is as follows –

```
CREATE [OR REPLACE] PROCEDURE procedure_name
```

```
[(parameter_name [IN | OUT | IN OUT] type [, ...])]
```

```
{IS | AS}
```

```
BEGIN
```

```
< procedure_body >
```

```
END procedure_name;
```

Where,

- *procedure-name* specifies the name of the procedure.
- [OR REPLACE] option allows the modification of an existing procedure.
- The optional parameter list contains name, mode and types of the parameters. **IN** represents the value that will be passed from outside and OUT represents the parameter that will be used to return a value outside of the procedure.
- *procedure-body* contains the executable part.
- The AS keyword is used instead of the IS keyword for creating a standalone procedure.

Example

The following example creates a simple procedure that displays the string 'Hello World!' on the screen when executed.

```
CREATE OR REPLACE PROCEDURE greetings
```

```
AS
```

```
BEGIN
```

```
dbms_output.put_line('Hello World!');
```

```
END;
```

```
/
```

Deleting a Standalone Procedure

A standalone procedure is deleted with the **DROP PROCEDURE** statement. Syntax for deleting a procedure is –

```
DROP PROCEDURE procedure-name;
```

You can drop the greetings procedure by using the following statement –

DROP PROCEDURE greetings;

Parameter Modes in PL/SQL Subprograms

The following table lists out the parameter modes in PL/SQL subprograms –

S.No	Parameter Mode & Description
1	IN An IN parameter lets you pass a value to the subprogram. It is a read-only parameter. Inside the subprogram, an IN parameter acts like a constant. It cannot be assigned a value. You can pass a constant, literal, initialized variable, or expression as an IN parameter. You can also initialize it to a default value; however, in that case, it is omitted from the subprogram call. It is the default mode of parameter passing. Parameters are passed by reference.
2	OUT An OUT parameter returns a value to the calling program. Inside the subprogram, an OUT parameter acts like a variable. You can change its value and reference the value after assigning it. The actual parameter must be variable and it is passed by value.
3	IN OUT An IN OUT parameter passes an initial value to a subprogram and returns an updated value to the caller. It can be assigned a value and the value can be read. The actual parameter corresponding to an IN OUT formal parameter must be a variable, not a constant or an expression. Formal parameter must be assigned a value. Actual parameter is passed by value.

Functions:

A function is same as a procedure except that it returns a value. Therefore, all the discussions of the previous chapter are true for functions too.

Creating a Function

A standalone function is created using the **CREATE FUNCTION** statement. The simplified syntax for the **CREATE OR REPLACE PROCEDURE** statement is as follows –

```
CREATE [OR REPLACE] FUNCTION function_name
[(parameter_name [IN | OUT | IN OUT] type [, ...])]
RETURN return_datatype
{IS | AS}
BEGIN
    < function_body >
END [function_name];
```

OUTPUT

```
mysql> delimiter $

5 rows in set (0.00 sec)

Result: The program is executed successfully and the output is obtained.

Experiment No.9

Aim: Write a PL/SQL block to implement all types of cursor.

Objective:

- To study and implement PL/SQL cursors.

Theory :

A **cursor** is a pointer to this context area. PL/SQL controls the context area through a cursor. A cursor holds the rows (one or more) returned by a SQL statement. The set of rows the cursor holds is referred to as the **active set**.

You can name a cursor so that it could be referred to in a program to fetch and process the rows returned by the SQL statement, one at a time. There are two types of cursors –

- Implicit cursors
- Explicit cursors

Implicit Cursors

Implicit cursors are automatically created by Oracle whenever an SQL statement is executed, when there is no explicit cursor for the statement. Programmers cannot control the implicit cursors and the information in it.

Whenever a DML statement (INSERT, UPDATE and DELETE) is issued, an implicit cursor is associated with this statement. For INSERT operations, the cursor holds the data that needs to be inserted. For UPDATE and DELETE operations, the cursor identifies the rows that would be affected.

In PL/SQL, you can refer to the most recent implicit cursor as the **SQL cursor**, which always has attributes such as **%FOUND**, **%ISOPEN**, **%NOTFOUND**, and **%ROWCOUNT**. The SQL cursor has additional attributes, **%BULK_ROWCOUNT** and **%BULK_EXCEPTIONS**, designed for use with the **FORALL** statement. The following table provides the description of the most used attributes –

S.No	Attribute & Description
1	%FOUND Returns TRUE if an INSERT, UPDATE, or DELETE statement affected one or more rows or a SELECT INTO statement returned one or more rows. Otherwise, it returns FALSE.
2	%NOTFOUND The logical opposite of %FOUND. It returns TRUE if an INSERT, UPDATE, or DELETE statement affected no rows, or a SELECT INTO statement returned no rows. Otherwise, it returns FALSE.
3	%ISOPEN

Always returns FALSE for implicit cursors, because Oracle closes the SQL cursor automatically after executing its associated SQL statement.

%ROWCOUNT

4 Returns the number of rows affected by an INSERT, UPDATE, or DELETE statement, or returned by a SELECT INTO statement.

Explicit Cursors

Explicit cursors are programmer-defined cursors for gaining more control over the **context area**. An explicit cursor should be defined in the declaration section of the PL/SQL Block. It is created on a SELECT Statement which returns more than one row.

The syntax for creating an explicit cursor is –

```
CURSOR cursor_name IS select_statement;
```

Working with an explicit cursor includes the following steps –

- Declaring the cursor for initializing the memory
- Opening the cursor for allocating the memory
- Fetching the cursor for retrieving the data
- Closing the cursor to release the allocated memory

Declaring the Cursor

Declaring the cursor defines the cursor with a name and the associated SELECT statement. For example –

```
CURSOR c_customers IS
```

```
SELECT id, name, address FROM customers;
```

Opening the Cursor

Opening the cursor allocates the memory for the cursor and makes it ready for fetching the rows returned by the SQL statement into it. For example, we will open the above defined cursor as follows –

```
OPEN c_customers;
```

Fetching the Cursor

Fetching the cursor involves accessing one row at a time. For example, we will fetch rows from the above-opened cursor as follows –

```
FETCH c_customers INTO c_id, c_name, c_addr;
```

Closing the Cursor

Closing the cursor means releasing the allocated memory. For example, we will close the above-opened cursor as follows –

CLOSE c_customers;

```

PL/SQL procedure successfully completed.

Result: The program is executed successfully and output is obtained .

Experiment No. 10

Aim: Write and execute suitable database triggers .Consider row level and statement level triggers.

Objective:

- To study and implement PL/SQL triggers.

Theory :

Triggers are stored programs, which are automatically executed or fired when some events occur. Triggers are, in fact, written to be executed in response to any of the following events.

- A **database manipulation (DML)** statement (DELETE, INSERT, or UPDATE)
- A **database definition (DDL)** statement (CREATE, ALTER, or DROP).
- A **database operation** (SERVERERROR, LOGON, LOGOFF, STARTUP, or SHUTDOWN).

Triggers can be defined on the table, view, schema, or database with which the event is associated.

Benefits of Triggers

Triggers can be written for the following purposes –

- Generating some derived column values automatically
- Enforcing referential integrity
- Event logging and storing information on table access
- Auditing
- Synchronous replication of tables
- Imposing security authorizations
- Preventing invalid transactions

Creating Triggers

The syntax for creating a trigger is –

```
CREATE [OR REPLACE ] TRIGGER trigger_name
{ BEFORE | AFTER | INSTEAD OF }
{ INSERT [OR] | UPDATE [OR] | DELETE }
[OF col_name]
ON table_name
[REFERENCING OLD AS o NEW AS n]
[FOR EACH ROW]
```

WHEN (condition)

DECLARE

Declaration-statements

BEGIN

Executable-statements

EXCEPTION

Exception-handling-statements

END;

Where,

- CREATE [OR REPLACE] TRIGGER trigger_name – Creates or replaces an existing trigger with the *trigger_name*.
- {BEFORE | AFTER | INSTEAD OF} – This specifies when the trigger will be executed. The INSTEAD OF clause is used for creating trigger on a view.
- {INSERT [OR] | UPDATE [OR] | DELETE} – This specifies the DML operation.
- [OF col_name] – This specifies the column name that will be updated.
- [ON table_name] – This specifies the name of the table associated with the trigger.
- [REFERENCING OLD AS o NEW AS n] – This allows you to refer new and old values for various DML statements, such as INSERT, UPDATE, and DELETE.
- [FOR EACH ROW] – This specifies a row-level trigger, i.e., the trigger will be executed for each row being affected. Otherwise the trigger will execute just once when the SQL statement is executed, which is called a table level trigger.
- WHEN (condition) – This provides a condition for rows for which the trigger would fire. This clause is valid only for row-level triggers.

OUTPUT

```
SQL> create table cust(id int,name varchar(10),age int,salary int);
```

Table created.

```
create or replace trigger display_salary_changes
before insert or delete or update on cust
for each row
when(New.id>0)
declare
sal_diff number;
begin
sal_diff:=New.salary-Old.salary;
dbms_output.put_line('old salary:' || Old.salary);
dbms_output.put_line('new salary:' || New.salary);
dbms_output.put_line('Salary difference:' || sal_diff);
end;
/
```

```
insert into cust values(2,'Arun',24,34000);
```

```
insert into cust values(1,'Anu',22,30000);
old salary:
new salary:30000
Salary difference:
1 row created.
```

```
SQL> insert into cust values(2,'Arun',24,34000);
old salary:
new salary:34000
Salary difference:
```

1 row created.

```
SQL> update cust set salary=35000 where id=1;  
old salary:30000  
new salary:35000  
Salary difference:5000
```

1 row updated.

```
SQL> delete from cust where id=2;
```

1 row deleted.

```
SQL> insert into cust values(2,'Arun',24,34000);  
old salary:  
new salary:34000  
Salary difference:
```

1 row created.

Result : The program is executed successfully.

Experiment No.11

Install and configure client and server for MongoDB (Show all commands and necessary steps for installation and configuration).

MongoDB

MongoDB is a cross-platform, document oriented database that provides, high performance, high availability, and easy scalability. MongoDB works on concept of collection and document.

Database

Database is a physical container for collections. Each database gets its own set of files on the file system. A single MongoDB server typically has multiple databases.

Collection

Collection is a group of MongoDB documents. It is the equivalent of an RDBMS table. A collection exists within a single database. Collections do not enforce a schema. Documents within a collection can have different fields. Typically, all documents in a collection are of similar or related purpose.

Document

A document is a set of key-value pairs. Documents have dynamic schema. Dynamic schema means that documents in the same collection do not need to have the same set of fields or structure, and common fields in a collection's documents may hold different types of data. The following table shows the relationship of RDBMS terminology with MongoDB.

MongoDB Features

- **General purpose database**, almost as fast as the key:value NoSQL type.
- **High availability**.
- **Scalability** (from a standalone server to distributed architectures of huge clusters). This allows us to shard our database transparently across all our shards. This increases the performance of our data processing.
- **Aggregation**: batch data processing and aggregate calculations using native MongoDB operations.
- **Load Balancing**: automatic data movement across different shards for load balancing. The balancer decides when to migrate the data and the destination Shard, so they are evenly distributed among all servers in the cluster. Each shard stores the data for a selected range of our collection according to a partition key.
- **Native Replication**: syncing data across all the servers at the replica set.
- **Security**: authentication, authorization, etc.
- **Advanced users management**.
- **Automatic failover**: automatic election of a new primary when it has gone down.

Installation Steps for MongoDB

1. Connect the system with the Internet.

2. Open the terminal and Execute the command
 `sudo apt-get update`
 `sudo apt-get install mongodb`
 `sudo service mongodb start`
3. Type mongo to start the mongodb terminal.
4. Now write your queries.

Result : The installation of MongoDB is done successfully.

MongoDB

Experiment

No.12

MongoDB

MongoDB is an open-source document database and leading NoSQL database.

Database

Database is a physical container for collections. Each database gets its own set of files on the file system. A single MongoDB server typically has multiple databases.

Collection

Collection is a group of MongoDB documents. It is the equivalent of an RDBMS table. A collection exists within a single database. Collections do not enforce a schema. Documents within a collection can have different fields. Typically, all documents in a collection are of similar or related purpose.

Document

A document is a set of key-value pairs. Documents have dynamic schema. Dynamic schema means that documents in the same collection do not need to have the same set of fields or structure, and common fields in a collection's documents may hold different types of data.

The following table shows the relationship of RDBMS terminology with MongoDB.

RDBMS	MongoDB
Database	Database
Table	Collection
Tuple/Row	Document
column	Field
Table Join	Embedded Documents
Primary Key	Primary Key (Default key _id provided by mongodb itself)

Advantages of MongoDB over RDBMS

Schema less – MongoDB is a document database in which one collection holds different documents. Number of fields, content and size of the document can differ from one document to another.

Structure of a single object is clear.

No complex joins.

Deep query-ability. MongoDB supports dynamic queries on documents using a document-based query language that's nearly as powerful as SQL.

Tuning.

Ease of scale-out – MongoDB is easy to scale.

Conversion/mapping of application objects to database objects not needed.

Uses internal memory for storing the (windowed) working set, enabling faster access of data.

Why Use MongoDB?

Document Oriented Storage – Data is stored in the form of JSON style documents.

Index on any attribute

Replication and high availability

Auto-sharding

Rich queries

Fast in-place updates

Professional support by MongoDB

Where to Use MongoDB?

Big Data

Content Management and Delivery

Mobile and Social Infrastructure

User Data Management

Data Hub

The use Command

MongoDB **use DATABASE_NAME** is used to create database. The command will create a new database if it doesn't exist, otherwise it will return the existing database.

Syntax

```
use DATABASE_NAME
```

Example

```
>use mydb  
switched to
```

To check your currently selected database, use the command **db**

```
>db  
mydb
```

If you want to check your databases list, use the command **show dbs**.

```
>show dbs  
local  
0.78125GB
```

Your created database (mydb) is not present in list. To display database, you need to insert at least one document into it.

The dropDatabase() Method

MongoDB **db.dropDatabase()** command is used to drop a existing database.

Syntax

```
db.dropDatabase()
```

This will delete the selected database. If you have not selected any database, then it will delete default 'test' database.

Example

First, check the list of available databases by using the command, **show dbs**.

```
>show dbs  
local0.78125GB  
mydb0.23012GB  
test0.23012GB  
>
```

If you want to delete new database **<mydb>**, then **dropDatabase()** command would be as follows –

```
>use mydb  
switched to  
dbmydb  
>db.dropDatabase()
```

```
>show dbs
local0.78125GB
test0.23012GB
>
```

The createCollection() Method

MongoDB **db.createCollection(name, options)** is used to create collection.

Syntax

```
db.createCollection(name, options)
```

Examples

```
>use test
switched to db test
>db.createCollection("mycollection")
{"ok":1}
>
```

You can check the created collection by using the command **show collections**.

```
>show
collections
mycollection
```

The drop() Method

MongoDB's **db.collection.drop()** is used to drop a collection from the database.

Syntax

Basic syntax of **drop()** command is as follows –

```
db.COLLECTION_NAME.drop()
```

The insert() Method

To insert data into MongoDB collection, you need to use MongoDB's **insert()** or **save()** method.

Syntax

The basic syntax of **insert()** command is as follows –

```
>db.COLLECTION_NAME.insert(document)
```

Example

```
>db.mycol.insert({
  _id:ObjectId("7df78ad8902c"),
  title:'MongoDB Overview',
```

```
description:'MongoDB is no sql
database', by:'tutorials point',
url:'http://www.tutorialspoint.com', tags:
['mongodb','database','NoSQL'], likes:100
}))
```

Here **mycol** is our collection name, as created in the previous chapter. If the collection doesn't exist in the database, then MongoDB will create this collection and then insert a document into it.

In the inserted document, if we don't specify the `_id` parameter, then MongoDB assigns a unique ObjectId for this document.

`_id` is 12 bytes hexadecimal number unique for every document in a collection. 12 bytes are divided as follows –

```
_id: ObjectId(4 bytes timestamp, 3 bytes machine id, 2 bytes process
id, 3 bytes incrementer)
```

To insert multiple documents in a single query, you can pass an array of documents in `insert()` command.

Example

```
>db.post.insert([
{
title:'MongoDB Overview',
description:'MongoDB is no sql
database', by:'tutorials point',
url:'http://www.tutorialspoint.com', tags:
['mongodb','database','NoSQL'], likes:100
},

{
title:'NoSQL Database',
description:"NoSQL database doesn't have tables",
by:'tutorials point',
url:'http://www.tutorialspoint.com', tags:
['mongodb','database','NoSQL'],
likes:20,
comments:[
{
user:'user1',
message:'My first comment',
dateCreated:new Date(2013,11,10,2,35),
like:0
}
]
```

```
]
}
])
```

The find() Method

To query data from MongoDB collection, you need to use MongoDB's **find()** method.

Syntax

The basic syntax of **find()** method is as follows –

```
>db.COLLECTION_NAME.find()
```

find() method will display all the documents in a non-structured way.

The pretty() Method

To display the results in a formatted way, you can use **pretty()** method.

Syntax

```
>db.mycol.find().pretty()
```

MongoDBUpdate() Method

The update() method updates the values in the existing document.

Syntax

The basic syntax of **update()** method is as follows –

```
>db.COLLECTION_NAME.update(SELECTION_CRITERIA, UPDATED_DATA)
```

Example

Consider the mycol collection has the following data.

```
{"_id":ObjectId(5983548781331adf45ec5),"title":"MongoDB Overview"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

Following example will set the new title 'New MongoDB Tutorial' of the documents whose title is 'MongoDB Overview'.

```
>db.mycol.update({'title':'MongoDB Overview'},{$set:{'title':'NewMongoDB Tutorial'}})
>db.mycol.find()
{"_id":ObjectId(5983548781331adf45ec5),"title":"NewMongoDB Tutorial"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
>
```

By default, MongoDB will update only a single document. To update multiple documents, you need to set a parameter 'multi' to true.

```
>db.mycol.update({'title':'MongoDB Overview'},
{$set: {'title':'NewMongoDB Tutorial'}},{multi:true})
```

MongoDBSave() Method

The **save()** method replaces the existing document with the new document passed in the save() method.

Syntax

The basic syntax of MongoDB **save()** method is shown below –

```
>db.COLLECTION_NAME.save({_id:ObjectId(),NEW_DATA})
```

The remove() Method

MongoDB's **remove()** method is used to remove a document from the collection. remove() method accepts two parameters. One is deletion criteria and second is justOne flag.

deletion criteria – (Optional) deletion criteria according to documents will be removed.

justOne – (Optional) if set to true or 1, then remove only one document.

Syntax

Basic syntax of **remove()** method is as follows –

```
>db.COLLECTION_NAME.remove(DELETION_CRITERIA)
```

Example

Consider the mycol collection has the following data.

```
{ "_id":ObjectId(5983548781331adf45ec5),"title":"MongoDB Overview"}
{ "_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{ "_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

Following example will remove all the documents whose title is 'MongoDB Overview'.

```
>db.mycol.remove({'title':'MongoDB Overview'})
>db.mycol.find()
{ "_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{ "_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

```
>
```

Remove Only One

If there are multiple records and you want to delete only the first record, then set **justOne** parameter in **remove()** method.

```
>db.COLLECTION_NAME.remove(DELETION_CRITERIA,1)
```

Remove All Documents

If you don't specify deletion criteria, then MongoDB will delete whole documents from the collection. **This is equivalent of SQL's truncate command.**

```
>db.mycol.remove()
```

```
>db.mycol.find()
```

```
>
```

The find() Method

Execute at least 10 queries on any suitable MongoDB database that demonstrates following:

- \$ where queries

- Cursors (Limits, skips, sorts, advanced query options)

- Database commands

MongoDB's **find()** method, explained in [MongoDB Query Document](#) accepts second optional parameter that is list of fields that you want to retrieve. In MongoDB, when you execute **find()** method, then it displays all fields of a document. To limit this, you need to set a list of fields with value 1 or 0. 1 is used to show the field while 0 is used to hide the fields.

Syntax

The basic syntax of **find()** method with projection is as follows –

```
>db.COLLECTION_NAME.find({}, {KEY:1})
```

Following example will display the title of the document while querying the document.

```
>db.mycol.find({}, {"title":1, _id:0})
```

```
{ "title": "MongoDB Overview" }
```

```
{ "title": "NoSQL Overview" }
```

```
{ "title": "Tutorials Point Overview" }
```

```
>
```

Apart from **find()** method there is **findOne()** method, that reruns only one document.

AND in MongoDB

Syntax

In the **find()** method, if you pass multiple keys by separating them by ',' then MongoDB treats it as **AND** condition. Following is the basic syntax of **AND**

```
>db.mycol.find(
  {
    $and: [
      {key1: value1}, {key2:value2}
    ]
  }
).pretty()
```

Example

Following example will show all the tutorials written by 'tutorials point' and whose title is 'MongoDB Overview'.

```
>db.mycol.find({$and:[{"by":"tutorials point"}, {"title":"MongoDB Overview"}]}).pretty(){
  "_id":ObjectId(7df78ad8902c),
  "title":"MongoDB Overview",
  "description":"MongoDB is no sql database",
  "by":"tutorials point",
  "url":"http://www.tutorialspoint.com",
  "tags":["mongodb","database","NoSQL"],
  "likes":"100"
}
```

For the above given example, equivalent where clause will be ' where by = 'tutorials point' AND title = 'MongoDB Overview' '. You can pass any number of key, value pairs in find clause.

OR in MongoDB

Syntax

To query documents based on the OR condition, you need to use **\$or** keyword. Following is the basic syntax of **OR** –

```
>db.mycol.find(
  {
    $or:[
      {key1: value1},{key2:value2}
    ]
  }
)
```

```
).pretty()
```

Example

Following example will show all the tutorials written by 'tutorials point' or whose title is 'MongoDB Overview'.

```
>db.mycol.find({$or:[{"by":"tutorials point"}, {"title":"MongoDB Overview"}]}).pretty()
{
  "_id":ObjectId(7df78ad8902c),
  "title":"MongoDB Overview",
  "description":"MongoDB is no sql database",
  "by":"tutorials point",
  "url":"http://www.tutorialspoint.com",
  "tags":["mongodb","database","NoSQL"],
  "likes":"100"
}
>
```

Using AND and OR Together

Example

The following example will show the documents that have likes greater than 10 and whose title is either 'MongoDB Overview' or by is 'tutorials point'. Equivalent SQL where clause is **'where likes>10 AND (by = 'tutorials point' OR title = 'MongoDB Overview')'**

```
>db.mycol.find({"likes":{"$gt":10}, $or:[{"by":"tutorials point"}, {"title":"MongoDB Overview"}]}).pretty()
```

The Limit() Method

To limit the records in MongoDB, you need to use **limit()** method. The method accepts one number type argument, which is the number of documents that you want to be displayed.

Syntax

```
>db.COLLECTION_NAME.find().limit(NUMBER)
```

Example

Consider the collection mycol has the following data.

```
{"_id":ObjectId(5983548781331adf45ec5),"title":"MongoDB Overview"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview" }
```

Operation	Syntax	Example	RDBMS Equivalent
Equality	{<key>:<value>}	db.mycol.find({"by":"tutorials point"}).pretty()	where by = 'tutorials point'
Less Than	{<key>:{ \$lt:<value>}}	db.mycol.find({"likes":{ \$lt:50}}).pretty()	where likes < 50
Less Than Equals	{<key>:{ \$lte:<value>}}	db.mycol.find({"likes":{ \$lte:50}}).pretty()	where likes <= 50
Greater Than	{<key>:{ \$gt:<value>}}	db.mycol.find({"likes":{ \$gt:50}}).pretty()	where likes > 50
Greater Than Equals	{<key>:{ \$gte:<value>}}	db.mycol.find({"likes":{ \$gte:50}}).pretty()	where likes >= 50
Not Equals	{<key>:{ \$ne:<value>}}	db.mycol.find({"likes":{ \$ne:50}}).pretty()	where likes != 50

OUTPUT

```
use db database7;
switched to db database7
> db;
manya
> db.dropDatabase();
{ "ok" : 1 }
> db
Database 7
@(shell):1:1
> db
